XCD 3.5-4.5/35-75 ZOOM LENS

The XCD 3.5-4.5/35 75 zoom lens is the ninth lens in the X-System lens range. The lens delivers the same outstanding image quality and edge sharpness as the XCD lenses with fixed focal length. This special high-performance lens covers the focal length range from light wide angle to light telephoto. The internal focusing keeps the length of the lens constant,

ensures fast focus and keeps the overall weight low.

This makes it ideal for photographers who want to take landscape photos or portraits, but want to take only a little equipment with them on their trips and do not want to compromise on image quality. As with all other XCD lenses, the XCD 35-75 has a central shutter with exposure times between 68 minutes and 1/2000 of a second - with continuous flash synchronization.

MAXIMUM MOBILITY WITH DIFFERENT FOCAL LENGTHS IN JUST ONE LENS

The different focal lengths of the XCD 35-75 give photographers a wide range of options - and all at the size of a travel zoom. Less equipment while having access to different focal lengths gives photographers enough flexibility to concentrate on the shoot itself and make adjustments quickly and without changing lenses.

ROAD. TRAVEL. PORTRAIT. LANDSCAPE.

The versatile XCD 35-75 is ideal for capturing a wide range of situations, from wide-angle landscape shots to portraits with a slight telephoto. It is therefore ideal for travel, street and portrait photography.

EXCELLENT LIKE A FIXED FOCAL LENGTH

The thoroughly tested high-performance XCD 35-75 lens is able to deliver first-class images at any focal length - as first-class as if it were an XCD fixed focal length. With a minimum distance of only 42cm from the subject, the XCD 35 - 75 is also ideally suited for close-up photography.
