Hasselblad H extension rings are designed for use with HC lenses and reduce the close focusing distance. The greater the extension, the more the image is enlarged. The intermediate rings can be used individually, in combination with each other or with other accessories depending on the application and desired effect. H extension tubes can only be used with Hasselblad H cameras and HC lenses.

Product information

Depending on your preference, the intermediate rings are first attached to the lens or directly to the camera body. There are no restrictions regarding the combination or order of the individual intermediate rings. They can be used with all HC lenses. However, it should be noted the common practice that certain lenses are not suitable for close-up photography. Intermediate rings can also be used together with a converter H1.7x. In this case, however, they must be attached between the converter and the lens. The autofocus function remains intact until the LCD indicates that autofocus is not supported for that particular combination and setting.
