Hyper uses an OCC (Ohno Continuous Casting) conductor of high purity copper with a PEF (Foamed Polyethylene) dielectric. This design and construction combines wide bandwidth with excellent resistance to RFI (Radio Frequency Interference), which can increase noise levels in a poorly shielded cable, resulting in a loss of detail at low levels. The Hyper Achromatic is equipped with our self-cleaning (simply remove and insert to clean the contact areas) Achromatic RCA connector. The low-mass Achromatic connector features a solderless, cold-welded connection that is optimized for a coherent, continuous signal path, resulting in a natural-sounding connection that provides a wide, open soundstage and fine resolution without excessive “detail” that is impressive on the surface but quickly becomes fatiguing to listen to.The Hyper range includes DIN and XLR connectors, digital interconnect cables and stereo and two-core speaker cables.
